“Scan a printer or existing Pick Label to continue” - Allow scan Pick Label - #275

Previously users had to scan a printer to start or continue a pick. If the pick already has a label this change allows users to scan the pick label.

Picking: Scan location should come before Enter Qty # 283

The order has been updated on the new devices so pickers have visibility of the requested location before they are asked to enter the pick quantity.

Picking: lock down backwards navigation with a prompt #285

Users will no longer be able to exit from a picking run on the devices without being prompted to confirm they're sure they want to do so.

Picking: Add the delivery type to the pick labels #286

Divert logging to new table for pallet consolidation (whole) #277

New logging method in place to aid system-wide performance.

Add new logging for transfer groups #196

As above for transfer groups (Outbound Orders).

Under the hood

- We are including orders in "Awaiting Rollcage" status on the open orders out report. This is to ensure no orders fall through the cracks when passing between pick, pack and despatch.
