Remove "Zero Selected" button from Open Orders Out Report #204	4
Select picks from list on device #161.....	5
Allow users to confirm Zero stock when picking #160	5
New "Picking Complete" step #163	5
Confirmation Page on Relocate Stock - Enter Qty is Repeating #139	7
Behind the Scenes	7

Goods In Quality Checks - cache buster needed #157

We have made some improvements to automatically renew the browser cache on the dashboard for the Goods in quality checks page. This means after each time we update the system, you are less likely to need to clear the browser cache to see the new changes.

Delivery Type not showing on open orders out report #171

We noticed that even after allowing the Delivery Type column to be shown in the Column Settings it still wasn't working. We've implemented a fix to resolve this issue:

Order(Out) #	Store #	Store	Postcode	Building	Order Recv'd	Status	Held	Part Pick	Req Units	Rec'd	Pre	Pre 2	Pick	Pack	Lines	Target Pick Date	% Picked	% Packed	Delivery Type	Cube	Weight

Show other locations: Relocate > Scan Location > Select SKU #143

We have the ability to scan a location click on the SKU as if we were relocating it then press P1 and select "Show other Locations" on the older devices. This functionality has now been ported to the new scanners.

Press the green button once the SKU has been selected:

What do you want?

View all locations

Mark as under Investigation

All locations for the SKU are listed:

The screenshot shows the Nexus dashboard interface. At the top, there is a header with the Nexus logo and a user profile for Dave Shaw. Below the header, a breadcrumb trail indicates the current page is 'Inventory > Relocate'. The main content area is titled 'Other locations for V038-P' and contains a table with two columns: 'Location' and 'Qty'. The table lists three locations: RA1AZ0122 (1248), RA1AZ0122 (2000), and 2Input (45). The second row is highlighted in light blue.

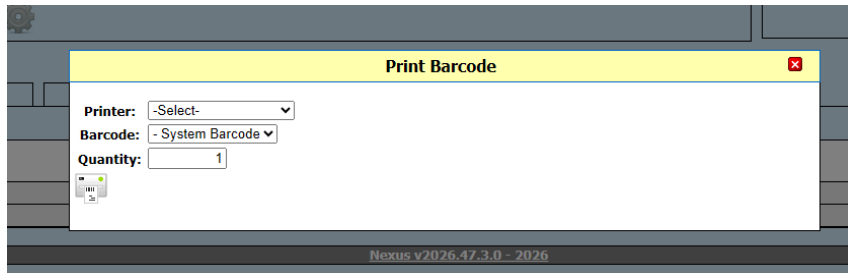

Location	Qty
RA1AZ0122	1248
RA1AZ0122	2000
2Input	45

Quarantine stock not showing as red on devices #150

Any quarantined stock shown on devices is now highlighted in red to match the Nexus dashboard.

Default to system barcode dropdown reprint SKU #166

When printing a SKU barcode from the dashboard, SKU Details page, the default barcode will be the System Barcode. This is the preferred barcode used by a lot of users and avoids the need to have to select it each time a label is needed.

Ensure new picking routine does not ask users to pick more than once per SKU and location #191

Changes have been made to make the picking routine more robust. When a picker is picking on the old devices, the system uses the stock ID so may ask the picker to repeat a pick in the same location without any visibility that this is what the system is asking for. The new process asks for a consolidated pick qty and will automatically pick the stock from the location across multiple records if needed.

Barcodes linked to multiple SKUs are causing the devices to error on Relocate #128

A bug has been fixed whereby any SKU linked to more than one barcode would previously cause issues with the new devices. The system now handles this scenario with more intelligence (filtering out SKUs that are not related to the current action) and flexibility (if an action does not have a SKU "context" we display a selection screen to ask the user which SKU they intend to use)

Remove "Zero Selected" button from Open Orders Out Report #204

This option has been removed from the open orders out report as it has recently caused some issues when used incorrectly.

Open Orders (Out)
Shows status of open orders (out).

Select picks from list on device #161

Users can now select from a list of orders to pick by pressing the green button on the device when they see the list of assigned orders.

Allow users to confirm Zero stock when picking #160

Users may now confirm 0 stock found when picking stock. This will create a stock discrepancy which is being handled in story #215

New "Picking Complete" step #163

A new screen has been added to help users decide what they want to do once their orders have been fully picked. Options are to get more orders to pick or exit picking on the device.

Pick More Orders

Confirmation Page on Relocate Stock - Enter Qty is Repeating #139

We have made changes to stop an issue on relocate happening. Previously the Enter Qty prompt would intermittently be displayed twice causing issues with the count.

Behind the Scenes

More changes behind the scenes have been made to improve performance and reduce the overall size of the system.

Printer management has added the printer ID so it's now visible and removed the need for this to use the "SiteManagementSystem" database that we aim to remove from the overall system completely.

We have done more work to de-couple Nexus from the "ATMS" system and pulled out code that was handling features we don't need.

Closing a pallet has had a lot of functionality removed for PAXD and returns that are simply not used or needed at Roxor so this will improve the performance of closing a pallet.

Order Out Details page has had some minor changes to improve performance. The changes will be slight at the moment, but we aim to have much bigger changes coming soon to improve the speed of this important dashboard page.
