Put away from Container Label #94999313	2
Refactor code to use a return value #51	3
Remove update to Site Management System for customer renames #89	3
Under the Hood	3

Stock Coverage – Improved logic #60

Previously, the current site the order was assigned to is not showing an accurate figure because it is also considered in the open orders list so reduces the available stock figure. This has now been resolved and implemented.

Columns Added to Replen Download #61

The fields "available qty" and "days cover" in have now been included in the stock replenishment tool download.

Actions	
	
Export SKU Level Data	
	
	

	A	B	C	D	E	F	G
1	SKU Number	SKU Description	Qty	Available Quantity	Days Cover Quantity	Required Quantity

System barcode scans #68

The new devices can now scan the system SKU barcodes to identify items of stock. These are barcodes that start with "7ART" and can be printed from the SKU details page on the dashboard.

Put away from Container Label #94999313

An issue has been fixed which was causing the device to fail when scanning a certain type of barcode label.

Refactor code to use a return value #51

This is an improvement to the works order process on the dashboard to handle exceptions and future proof the process.

Remove update to Site Management System for customer renames #89

A link to an old sub-system called Site Management System has been removed from the customer details page. This was causing some issues when amendments were made and saved.

Under the Hood

- We have made improvements to the search page on Nexus to make it more stable and remove parts of the system that are not used. The existing functionality that is used by Roxor remains unchanged.
- We have changed an underlying Excel export tool to avoid bugs in future when changes are made.
- Automatic compile and system versioning has been enabled on the project now. This has some effects on performance and should mean that once the dashboard has completed its “startup” phase, pages should load faster. During startup phase, the dashboard will be as slow as it was previously but after this phase it should perform slightly faster.
- An error when updating the customer details page has been fixed and tested.
